**Abstract ABSTRACT OF THE DISCLOSURE**

A device (1) for a hair dryer (2), having a fan (3) and a heater (4) for generating a central hot air stream (5) and a concentric cold air stream (6) at a blower opening (7). As the device (1), an air nozzle attachment (8) embodied as connectable to the blower opening (7) is provided of a kind such that the air nozzle attachment (8), from the central hot air stream (5) and the concentric cold air stream (6) of the hair dryer (2), generates a hot air stream (9) and a cold air stream (10) that are located side by side (Fig. 1).

The hair dryer (2) has a device (1) for generating a central hot-air stream (5) and a concentric cold-air stream (6) or only a single stream (9) of hot air. The device includes a fan (3), a heater (4), a first detachable air nozzle attachment (8) for the central hot-air stream (5) and the concentric cold-air stream (6) and a second detachable air nozzle attachment (23) for the single stream (9) of hot air. The first detachable air nozzle attachment (8) is made of heat resistant plastic and includes a flat hot-air nozzle (13), a flat cold-air nozzle (14) next to it and a snap-on coupling device (18) for releasable attachment of the air nozzle attachment (8) over the blower opening (7), which permits rotation of the first detachable air nozzle attachment (8).
